neofetch in Debian Linux

When it comes to reporting basic OS information in one terminal screen for easy screenshot, I’ve been using `screenFetch` most of the time. Turns out, it’s not the only software of this kind – and `neofetch` is a great alternative.

neofetch or screenFetch?

Notice how I didn’t say `neofetch` VS `screenFetch`!

Because mostly the choice between `neofetch` and `screenFetch` is a personal preference: both tools are quite capable and available on majority of popular operating systems.
Reasons to use neofetch

Compared to `screenFetch`, `neofetch` has a few really cool features:

- Server hardware model reported
- On desktop systems, the following is reported
  - Windows manager and sometimes even desktop theme
  - Screen resolution
- Better reporting of IP addresses
- Lots of configuration options
