

# SSH Reference Mindmap

I haven't shared this on [Unix Tutorial](#) before, but I'm a huge fan of mindmaps. I create and use them all the time for any process or knowledge that I am working with.

It seems to me that all the [Unix Reference](#) pages I'm creating will greatly benefit from mindmaps, so here's an example of what I mean:

SSH Reference Mindmap

# Why I Like Mindmaps

- it's a great way to mentally place certain pieces of knowledge to where they belong – so that you understand how certain topics relate to each other and this means you'll remember them better
- a mindmap is an awesome and very quick way to refresh your knowledge about something – even without specifics like port numbers and command lines you can still learn, remember and recall a lot
- a mindmap is invaluable to highlighting gaps in knowledge – as you place broad topics into the mindmap branch, you often realise that you need to learn more before that section is complete
- it's a great learning tool – I can just add questions about things I don't know and come back later to update them with newly learned pieces of information

Let me know what you think!

pS: I'm preparing my [Unix Tutorial Patreon](#) page this month – so check it out and let me know how I can make [Unix Tutorial](#) better to help you learn and succeed. It will mean a lot if you decide to become a patron!
