Updates to Unix Reference pages

You may have noticed: I'm finally getting really close to organising the first few technologies of Unix and Linux kind into proper Unix Reference pages!

Unix Tutorial Reference

I have <u>created the Unix Tutorial Reference section more than</u> 10 years ago. Initially it's just been an index of pages on Unix Tutorial, but lately I've been re-thinking its purpose and making updates.

What I want <u>Unix Tutorial Reference</u> page to be is a collection of the most impactful and useful content here on my blog. For

now, there's less than 10 technologies I want to expand and link from the Reference page, but eventually we'll see more.

Unix Reference Pages

Each <u>Unix Tutorial Reference</u> page will be found under the **Reference** section. Each such reference page will aim to be an ever-growing technical introduction to a chosen topic — complete with defintions and relevant support commands.

I've got only two reference pages properly started at this stage:

- SSH Reference everything I have written about SSH to date, eventually will be enough to act as complete introduction and how-to guide for managing both SSH server and SSH client.
- <u>SELinux Reference</u> more structured guide but a shorter page. I want it to read as a 1-pager explaining what **SELinux** is and how it can be used and managed.

Please check out the <u>Unix Tutorial Reference</u> page, <u>SSH</u>
<u>Reference</u> or <u>SELinux Reference</u> and let me know what you think!
